Workshop

From Text to Machine-Readable Knowledge: TEI/XML, LLMs, and Linked Data for Korean Literature and Heritage

October 23, 2026
11:00 AM - 03:30 PM

Seminarraum Koreanologie
Entrance 5.4 (1. floor)

Event Program I

11:00

Byungjun Kim – *Introduction: Why Machine-Readable Data?*
Why structured, machine-readable data matters even more in the age of LLMs. The talk introduces TEI as a record of scholarly interpretation, presents KNoTE (an open TEI corpus of 33 modern Korean novels), and frames the sessions that follow.

Seonyeong Park – *Collaborative Encoding: A Model for Korean Literature*
Encoding is interpretation, so a team needs shared rules. This talk presents the shared manual and workflow behind KNoTE, including rules for the particular features of early modern Korean texts.

Gayeon Kim – *Semi-Automated TEI/XML Encoding of Modern Korean Novels (hands-on)*
Participants use an LLM-based web app to encode a short passage of a Korean novel and then find and fix the model's errors. No knowledge of Korean is needed, as English glosses are provided.

13:00

Break

Event Program II

13:30

Haein Ji (with Byungjun Kim) – *An Agentic Framework for Semi-Automated TEI/XML Encoding of Multilingual Literary Texts (hands-on)*
This talk presents an LLM agent that checks its own output for text preservation and schema validity, and repairs its errors in a staged pipeline. It is tested on Korean novels (KNoTE), English and French novels (ELTeC), and German verse drama (GerDraCor).

Songyi Jung – *Semantic Data for Korean Studies: A First Step into Knowledge Graphs with RDF (hands-on)*
An introduction to RDF triples, Protégé and SPARQL using Korean cultural heritage examples. It ends with a case study of a Graph-RAG museum guide.

Byungjun Kim – *Wrap-up: From Encoded Texts to AI-Enhanced Reading*
The wrap-up draws the sessions together and discusses next steps for TEI-aware AI and possible collaboration.
